Beyond the Flagship: Our Three-Phase Technology Roadmap
EVAP Solar is not just an EV charging company. We are building an integrated clean energy technology platform with a clear, phased execution plan.

[Explore Our Innovation Pipeline]

Who We Are (Introduction Block)

EVAP Solar is an integrated clean energy technology company building India's first modular, off-grid solar EV charging system—designed to address India's challenges in achieving renewable energy goals through clean energy for EV adoption.

Alongside this flagship innovation, we deliver reliable solar-plus-storage systems for residential, commercial, and industrial clients, bridging the gap between today's energy needs and tomorrow's breakthroughs.

Our Focus Areas (2-Column Layout for Balance)

The EVAP Difference

We don't just build solar systems. We build energy independence.

Our flagship innovation—India's first modular, off-grid solar EV charging system—is designed to work anywhere, independent of the grid. Autonomous. Renewable-powered. Ultra-fast direct-charging for automobiles. It is our answer to India's twin challenges: accelerating EV adoption while meeting renewable energy goals.

This same philosophy of integration and independence runs through everything we do. Whether installing solar-plus-storage for a home or developing next-generation zinc batteries, we engineer systems that are:

- Grid-independent by design
- Renewable-powered at their core
- Scalable for India's diverse needs
- Built to last with rigorous science

Our Impact (Stats Bar)

Dual-Pathway Call to Action

SECTION 2: PRODUCTS

Product Landing Header

Solutions for India's Energy Future

From grid-independent EV charging to reliable solar-plus-storage

Product 1: Solar EV Charging (Flagship)

Product 2: Solar Installation

Product Note

Every EVAP Solar system—whether our flagship EV charging solution or a residential installation—is designed with future integration in mind: ready to incorporate our next-generation solar cells and proprietary zinc-battery technology as they become available.

SECTION 3: INNOVATION PIPELINE

Pipeline Landing Header

Building Tomorrow's Energy Technologies

From materials discovery to manufacturable systems

Pipeline 1: Next-Gen Solar Cell Technology

Pipeline 2: Beyond Lithium Batteries

R&D Collaboration Note

Incubated at the National Institute of Solar Energy (NISE)
– EVAP Solar is proud to be incubated at NISE, India's premier institution for solar energy research and certification under the Ministry of New and Renewable Energy (MNRE), Government of India. This partnership provides us with access to world-class testing facilities, manufacturing expertise, and policy guidance as we scale our technologies.

Our innovation pipeline is further strengthened by academic collaborations, including with Prof. R. Geetha Balakrishna at Jain University, ensuring our research remains rigorous and commercially translatable.

SECTION 4: ABOUT US

About Us Landing Header

Engineering India's Clean Energy Future

Material scientists. Systems engineers. Innovators.

Our Story

EVAP Solar was founded to address a fundamental challenge in India's clean energy transition: true energy independence requires systems that work beyond the grid.

While abundant sunlight provides the foundation, its full potential remains locked without intelligent integration—

seamlessly uniting advanced solar generation, purpose-built storage, and smart management into autonomous, reliable systems.

Our journey began with Dr. Altaf P, a physicist whose career spans advanced research at global institutions and hands-on manufacturing training at Tata Power Solar through NISE, MNRE. This dual perspective—laboratory innovation and ground-level implementation—shaped a clear conviction: India needs both breakthrough science and deployable, manufacturable solutions designed for its unique energy landscape.

This conviction found its first expression in our flagship innovation: India's first modular, off-grid solar EV charging system. Autonomous. Renewable-powered. Ultra-fast direct-charging for automobiles. Built to work anywhere, independent of the grid—addressing India's twin challenges of accelerating EV adoption while meeting renewable energy goals.

To engineer the complete energy system, we integrated the groundbreaking battery research of Dr. T. Prahlada. His expertise in zinc-ion and zinc-sulfur chemistries forms the scientific core of our stationary storage solutions, designed for safety, sustainability, and scalability—deliberately prioritizing these essentials over the high-density but resource-constrained lithium-ion alternatives.

Completing our technical core is Dr. Manikanta P. , our Scientific Advisor for electrochemistry and materials synthesis. His expertise in advanced material design bridges our storage and solar R&D, ensuring innovations translate from novel materials into scalable hardware.

As an incubated startup at the National Institute of Solar Energy (NISE) , we benefit from world-class testing facilities, manufacturing expertise, and policy guidance—accelerating our journey from lab to market.

Together, we are building an integrated energy technology company—material scientists and systems engineers creating synergistic solutions: from grid-independent EV charging stations to certified perovskite precursors, from zinc-based BESS to fully integrated solar-plus-storage systems.

Founder's Message: Why EVAP Solar

From the desk of Dr. Altaf P, Founder & CEO

I have spent over a decade studying solar energy—first as a physics student, then as a researcher at world-class institutions, and finally on the manufacturing floor at Tata Power Solar, trained under NISE, MNRE. Along this journey, one truth became unmistakably clear:

India's energy transition cannot wait for the grid to catch up.

We have brilliant science in our laboratories and ambitious targets in our policy documents. But between them lies a gap—a valley of death where promising technologies stall, where imported solutions misalign with local conditions, and where ground-level implementation struggles to keep pace.

I founded EVAP Solar to build across this gap.

Our flagship innovation—India's first modular, off-grid solar EV charging system—is born from this vision. It is designed to work anywhere, independent of the grid. Autonomous. Renewable-powered. Ultra-fast direct-charging for automobiles. It is my answer to the question that has driven me since my days at the lab bench and on the manufacturing line:

How do we deliver clean energy where it is needed most, even when the grid cannot?

But this is just the beginning. The same philosophy drives everything we do:

- Solar-plus-storage systems for homes and industries, built for performance and future integration
- Perovskite technology acceleration to help the entire industry move faster
- Zinc-ion BESS for safe, scalable stationary storage

EVAP Solar is my answer to India's energy challenges. Not just a company. A bridge between what is possible and what is needed.

Join us.

— Dr. Altaf PFounder & CEO, EVAP Solar

Our Three-Phase Roadmap: From System Integration to Next-Gen Manufacturing

EVAP Solar is executing a clear, phased strategy to build India's most integrated clean energy technology platform.

[\[View Full Roadmap\]](#) • [\[Explore Innovation Pipeline\]](#)
EVAP Solar is engineering smarter, safer, and more sustainable energy systems—where advanced solar harvesting and purpose-built storage unite to power a resilient future.

Mission & Vision

Our Team

Dr. Altaf P

Founder & CEO

Dr. Altaf P is a physicist and solar energy specialist with a deep commitment to bridging laboratory innovation and on-ground implementation. Trained and certified by the National Institute of Solar Energy (NISE) under MNRE in solar cell and module manufacturing, he gained hands-on industry experience at Tata Power Solar, one of India's leading solar manufacturers. This unique combination of advanced research and shop-floor training shapes his conviction that India's energy transition requires solutions designed for its unique landscape—including grid independence.

His doctoral research focused on next-generation photovoltaics, including halide perovskites and CIGS thin-film solar cells, with international fellowships at KIT (Germany) and Rice University (USA) as a Fulbright Scholar. At EVAP Solar, he leads the development of India's first modular, off-grid solar EV charging system, alongside solar-plus-storage solutions and the perovskite technology accelerator.

Dr. T. Prahlada

Head of Technology (Energy Storage)

Dr. Prahlada is a chemist specializing in electrochemical energy storage, with a PhD in zinc-ion and zinc-sulfur battery systems. His research prioritizes safety, sustainability, and scalability for stationary grid applications—deliberately moving beyond lithium-ion's high-density but resource-constrained paradigm. He leads EVAP Solar's proprietary BESS development.

Prof. R. Geetha Balakrishna

Scientific Advisor

Prof. Balakrishna is a distinguished leader in renewable energy materials and Director of the Centre for Nano and Material Sciences at JAIN University. With over two decades of research, 220+ publications, and multiple patents in photovoltaics, quantum dots, and energy storage, she provides strategic scientific guidance to EVAP Solar.

Dr. Manikanta P.

Lead of Electrochemical R&D

Dr. Manikanta P. is an Assistant Professor and materials electrochemist specializing in nanostructured materials for energy and sensing applications. With international research experience at the Polytechnic University of Turin, Italy, he guides EVAP Solar's R&D in electrochemical analysis.
